

Homebrew channel install with Twilight Hack]

+Copy over the [save file](#) for your version of Zelda.

****NOTE If you are on firmware 3.4 ONLY**, you must delete data.bin and **rename Twilight3.4.bin to data.bin** before

you copy it over. This ensures you are using the correct version of the

hack. You must run Zelda right after you

copy the hack over or the [system](#) menu will delete it and you will have to copy it over again.

+Once the hacked save file is copied over, run Zelda. Talk to the nearby man or walk backwards to initiate

the install of the homebrew channel (which is the boot.dol in the root of your [SD card](#))

Congrats, you should now have Homebrew Channel installed!

[STEP 1] [Perform these steps **ONLY** you are already on 3.3 or 3.4 otherwise Skip to Step 2]

+Load Wad Manager in Homebrew Channel and install IOS16-64-v257-prod.wad

Yes, even if you have received errors trying to install other wads this should still work.

+Load Custom WM in Homebrew Channel and install cios_fix.wad

You cannot install this wad with Wad Manager. This is a custom wad manager designed to work for IOS16.

+Load IOS Downgrader in Homebrew Channel. Just follow any prompts until it tells you it is complete.

****Note: This is NOT the same as the cIOS downgrader.** The cIOS downgrader allows you to upgrade or downgrade to the ideal firmware version which is 3.2. The reason 3.2 is so popular is partially because versions after this one had the Trucha bug fixed, and almost as importantly ver 3.2 is required to run Starfall. Starfall is important because it is at this time one of the only ways to fix a partially bricked Wii. It is also handy for skipping disk updates.

[STEP 2] [Perform these steps if you are **NOT** on version 3.2. If you **ARE** on 3.2, skip to STEP 3]

+Load cIOS Downgrader in Homebrew channel MAKING SURE you PICK YOUR CORRECT REGION. Follow prompts until done.

3.2U = USA/Canada, 3.2E = Europe, 3.2J = Japan

****Note: Once again, this is NOT the same as IOS Downgrader.** This is what will upgrade or downgrade you to version 3.2 firmware which will allow you to install starfall. Starfall is important because it is at this time one of the only ways to fix a partially bricked Wii. It is also handy for skipping disk updates.

[STEP 3] [You should now be on version 3.2 for your region. You're almost done!]

+Load Starfall with Homebrew Channel.

If you read the disclaimer carefully, you will see you are instructed to press B+1 and not B+2. Press B+1 until you get to the next screen. It is very picky so dont be surprised if you have to keep pressing it a number of times.

At the next screen the most important things to install are the last 3 options. Many people like to just install everything which is okay too.

+Run cIOS Installer in Homebrew Channel.

This installs the IOS needed by the launcher.

+Load "Install Shop IOS51". Say Yes to installing IOS51 and Yes to patching a fix but No to the Wii Shop Channel.

+Load Wad Manager in Homebrew Channel and install:

DjTaz_gamma Loader.wad - This will give you a Gamma launcher channel. You can skip this if you prefer to launch backups from HBC or wish to install a different channel loader.

You can also optionally install IOS38, as in some cases it is needed to run Animal Crossing.
